GROUP TASKS

Experience: The experience was useful because it helped bring the class design into an actual working Java program. The group worked with classes such as Client, Product, WishlistItem, and StoreSystem, then connected them through UserInterface so the program could be run interactively with the required java UserInterface command. Testing the program made it easier to verify that clients and products were created correctly, wishlists were updated properly, and the required information was displayed in a clear format.

One of the more important parts of the experience was seeing how the classes depended on each other. For example, the StoreSystem manages clients and products, while each Client manages its own wishlist items. The testing process also helped identify issues such as duplicate data or missing files before the final version was placed in the group repository.

Individual Performance: Individual performance was generally reasonable. Each group member was responsible for completing assigned portions of the Stage 1 implementation. I participated in testing the final program through the UserInterface to confirm that the required client, product, and wishlist operations worked as expected. No major performance issues affected completion of the assigned work.
