Summary:

I was responsible for implementing the Product class for Stage 1 of Project 1. I completed the coding and testing of the Product class on 09/2/2026. The class stores the product ID, product name, quantity in stock, and sale price. I also created a separate ProductTest driver to test the class.

My contribution to the group was implementing and testing the Product class so that it can be integrated into the group's Stage 1 Warehouse system.

Guide:

1. Open the `Project1Individual` GitHub repository.
2. Download or clone the repository to your computer.
3. Open the folder containing the Product files in a terminal or command prompt.
4. Make sure the folder contains:

```
Product.java
ProductTest.java
```

5. Compile the Product class and test driver:

```
javac Product.java ProductTest.java
```

6. Run the Product test driver:

```
java ProductTest
```

7. Review the output and verify that each Product displays the correct:
    - Product ID
    - Product name
    - Quantity in stock

    - Sale price
8. Confirm that the output matches the values used in `ProductTest.java`.
9. Review the included `ProductTestSession.txt` file to see the saved compilation and testing results.
