Warehouse Business Processes

Group 1

Add New Clients

The system allows a new client to be added. The client provides their name and address, and the system generates a unique client ID.

Add Products

The system allows products to be added to the warehouse inventory. Each product is given a system-generated product ID and includes a name, quantity in stock, and sale price. Multiple products can be added at the same time.

Record Customer Transactions

The system records transactions involving a client. Each transaction includes the date, a descriptive string explaining the transaction, and a dollar amount.

Manage Client Wishlists

A client can add products and desired quantities to their wishlist. The system keeps track of the products and quantities that the client is interested in purchasing.

Process Client Orders / Checkout

The system processes a client's order by reviewing the client's wishlist and allowing products and quantities to be selected. Additional products can also be added to the order. Products that

are available are prepared for shipment and included on an invoice, while unavailable products are placed on a waitlist. The cost of the shipped products is charged to the client's account.

Generate Invoices

The system generates an invoice containing the products being shipped, their quantities, sale prices, and the total cost. Invoices are generated when an order is processed or when previously wait-listed products become available.

Accept Client Payments

The system records payments made by clients and credits the payment amount to the client's account. Payments are independent of the ordering and shipping processes.

Accept Product Shipments

The system records incoming shipments of products. When a shipment arrives, wait-listed orders for that product are filled first. Any remaining quantity is then added to the product's inventory.

Query Client Transactions and Balances

The system allows the user to view all transactions for a specified client and identify clients who have an outstanding balance.

Query Product Inventory and Waitlisted Quantities

The system allows the user to view products, their current quantity in stock, and the total quantity of each product that is currently outstanding or wait-listed.

Verify System Operations

The system should provide additional queries as needed to verify that each business process is functioning correctly. For example, after adding clients, the system should provide a way to display all clients.
